AI Accelerator - QA Track

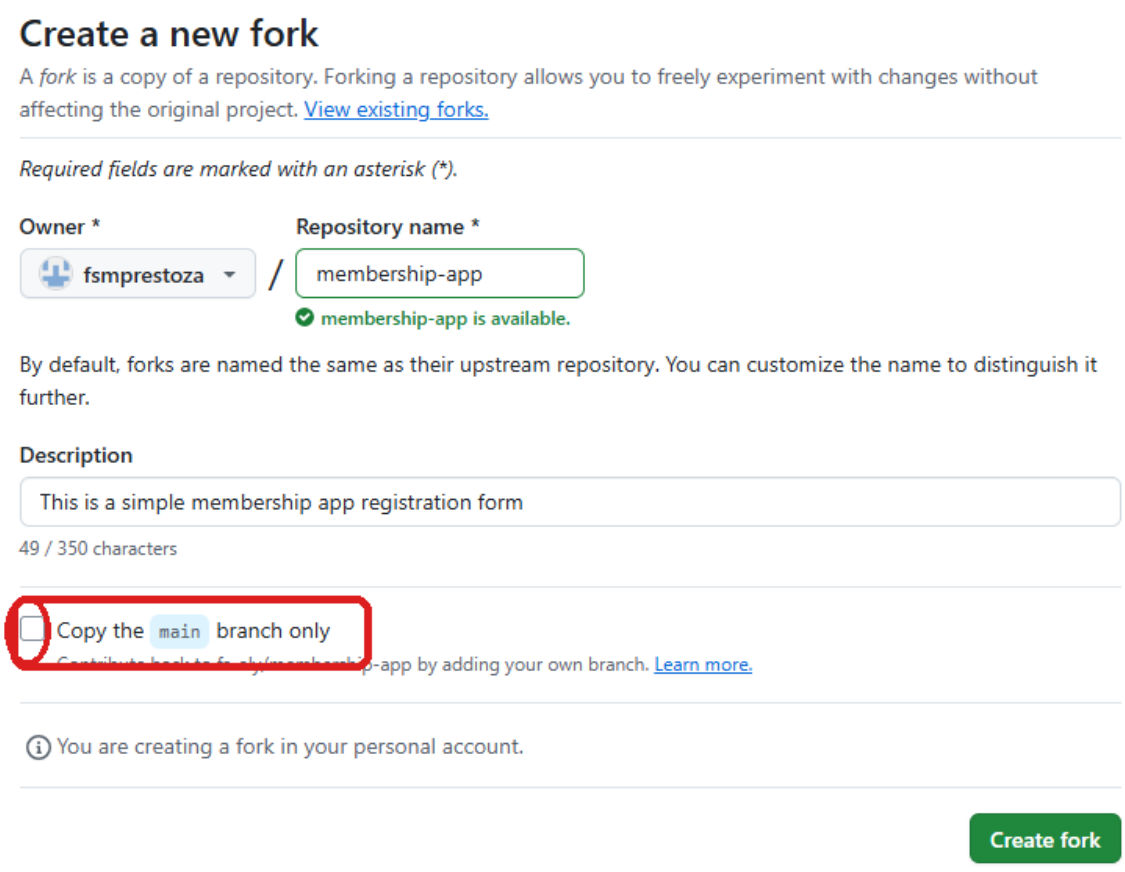

Week 2 Participant Execution Guide

Use the provided Membership App as the common test environment. You are free to choose the AI-generated QA artifact you want to validate. One test case can be one artifact.

1. Fork and Clone the Membership App

- Open the Membership App repository: https://github.com/fs-ely/membership-app.
- Click **Fork** and create the fork under your own GitHub account.
- Keep the repository name as **membership-app**, unless you have a specific reason to rename it.
- **UNCHECK "Copy the main branch only".** This is required so your fork includes all branches from the source repository, not only the main branch.
- Click **Create fork**.
- After the fork is created, clone your fork to your local machine.
- Set up and run the application locally and confirm that it works before starting the Week 2 activities.

IMPORTANT: Make sure **"Copy the main branch only"** is **unchecked** before you click **Create fork**. The highlighted option in the screenshot below should remain unchecked.

The red highlight shows the **"Copy the main branch only"** option. Leave this checkbox **unchecked**.

2. Open the Repository in OpenCode

- Open the cloned repository in OpenCode.
- Allow OpenCode to access and analyze the cloned repository.
- Choose a feature or area of the Membership App that you want to work on.
- Run your exact QA prompt based on how you want AI to support your testing work.
- Save the exact prompt and the complete AI-generated output in your Markdown (.md) evidence file.
- Manual and Automation Testers have the freedom to decide how they want to use AI for their QA work.

3. Choose One AI-Generated Artifact

Review the AI-generated output and select **one artifact** that you want to validate. **One test case can be one artifact.** If AI generates multiple test cases, you may select one test case and use that single test case as your artifact.

- **Manual QA examples:** test case, test scenario, expected result, test data, requirements analysis, defect analysis, exploratory charter, or another relevant QA artifact.
- **Automation QA examples:** test script, assertion, selector/locator, test data/fixture, automation fix, failure analysis, helper code, API test, or another relevant automation artifact.
- These are examples only. You are not limited to these artifact types.

> **Key rule:** Choose one artifact that you can actually validate against the provided application, requirements, repository/code, or other available evidence.

4. Create a Lab Record

- Log in to the QA Training Platform: https://qa.mprestoza.com.
- Create a Lab Record for your selected artifact.
- Provide the required information about the artifact and your testing context.
- Use this Lab Record as the basis for your Week 2 Activities 1-3.

5. Run the Six Validation Checks

Validate the selected artifact using all six checks: **SOURCE -> SCOPE -> SPEC -> CROSS-CHECK -> RUN -> LOG**.

Check	What to do
Source	Check what information, files, requirements, or context AI used.
Scope	Confirm that the AI output stayed within the requested task and feature.
Spec	Compare the AI output with the actual requirements/specifications.
Cross-check	Verify important AI claims using the application, requirements, repository/code, documentation, logs, or other
Run	Execute or test the selected artifact against the actual Membership App when applicable.
Log	Record what you checked, what you found, your evidence, and what you accepted, modified, or rejected.

> **Important:** Do not simply mark the checks as complete. Document what you actually checked, how you checked it, and what you discovered.

6. Identify a Real Issue in the AI Output

During validation, determine whether the AI output contains a real issue. This may include an incorrect expected result, unsupported assumption, invented requirement or behavior, incorrect test step, missing scenario, invalid selector/locator, incorrect assertion or automation logic, or an incorrect conclusion.

> **Example:** If AI says, "A success message should appear after clicking Create," but the specification does not require a success message, do not automatically report the application as defective. Your finding may instead be that AI introduced an unsupported expected result. Always distinguish between **AI output is wrong** and **the application actually has a defect**.

7. Complete Activities 1-3 Using the Selected Lab Record

- **Activity 1 - Validation Checklist:** Apply and document all six validation checks for your selected artifact.
- **Activity 2 - AI-Wrong Case:** Document at least one concrete case where AI was incorrect, incomplete, misleading, or made an unsupported assumption. Include the AI output, actual truth, evidence, how you caught it, and what you did differently.
- **Activity 3 - Pre-Acceptance Validation:** Before accepting or applying AI output, ask: **"What exactly will this touch, and where does it run?"** Validate the possible impact and document whether you accepted, modified, or rejected the AI output.
- Use the same selected Lab Record/artifact as the basis for Activities 1-3.

8. Complete Your Evidence and Submission

- Make sure Activities 1-3 are complete in the QA Training Platform.
- Make sure your Lab Record contains your validation findings.
- Save the exact AI prompts and complete AI-generated outputs in your Markdown (.md) evidence file.
- Include screenshots, logs, execution results, requirements, or other supporting evidence where applicable.
- Complete the required Week 2 Daily Logs.
- Review your work and evidence before submission.

9. Record and Submit Your Weekly Summary Video

After completing Activities 1-3 and your evidence, record a weekly summary video that walks through the work you completed during Week 2. Use your actual Lab Record, AI output, validation findings, and evidence during the walkthrough.

- Introduce the feature or area of the Membership App you worked on.
- Explain how you used AI during your QA work.
- Show the artifact you selected and briefly explain why you selected it.
- Show or explain the original AI prompt and AI-generated output.
- Walk through how you applied Source, Scope, Spec, Cross-check, Run, and Log.

- Explain the issue you discovered in the AI output.
- Show the evidence that supports your finding.
- Explain what you ultimately accepted, modified, or rejected.
- Briefly share what you learned and how you can apply this validation approach to actual QA work.
- You may use any screen-recording tool available to you.

Before recording: Make sure Activities 1-3, your Lab Record, Markdown evidence file, supporting evidence, and Daily Logs are complete so you can use them during your walkthrough.

Final Week 2 Execution Flow

Fork Repo (uncheck Copy the main branch only) -> Clone Repo -> Run Membership App -> Open Repo in OpenCode -> Run Your QA Prompt -> Save Exact Prompt & AI Output -> Choose 1 Artifact (e.g., 1 Test Case) -> Create Lab Record -> Run 6 Validation Checks -> Document Findings & Evidence -> Complete Activities 1-3 -> Complete Daily Logs -> Record & Submit Weekly Summary Video
