Week 4 Participant Guide - Manual and Automation QA

Goal

Use your work from Weeks 1-3 to demonstrate that you can apply AI, validate its output, explain your QA decisions, and reuse an effective workflow.

Complete three activities:

1. Build and validate a reusable AI asset.

2. Complete a mock interview with your assigned partner.

3. Complete the formal reassessment.

Before you begin

- Review your Week 1-3 submissions, evidence, daily logs, and coach feedback.

- Complete any required revisions. Week 1 is General Training reporting only and requires five daily logs; Week 2 requires three; Week 3 requires five.

- Continue using the same GitHub repository from Weeks 1-3 for your practical work.

- Manual QA participants validate and execute test cases manually. Automation QA participants review cases, implement suitable automated tests, and verify the results.

- Follow the requirements shown in each Week 4 activity in the QA Training Platform. If a required field or criterion differs from this guide, ask your coach to clarify it before submitting.

Activity 1 - Build a reusable AI asset

What you must do

1. Choose a prompt or checklist from your own repeated QA work.

2. Give the asset a clear name and purpose. Explain who should use it and when.

3. Replace task-specific details with placeholders, such as feature name, requirements, and test data.

4. Apply it to one real task and validate the output.

5. Reuse it on a second, different feature or scenario in the same repository.

6. Record what you accepted, corrected, or rejected and explain why. Document any changes to the prompt.

7. Put the asset, usage instructions, both tasks' inputs and AI outputs, and validation results in a Markdown (`.md`) file.

8. Upload the file under **Week 4 > Activity 1 > Evidence**. Complete the required activity fields and submit the activity for review.

Uploading evidence alone does not replace submitting the activity.

Sample Reusable AI Asset: Requirement-Based Test Case Generator

Purpose: Generate test cases for a feature, then validate them against its requirements and actual behavior.

For: Manual and Automation QA

Use when: Testing a new feature or a change to an existing feature.

This is a sample. Adapt it to your own application and include your actual validation evidence.

How to use the sample

1. Gather confirmed requirements, observed behavior, and available test data for your first feature.

2. Copy the prompt below into your AI tool. Replace every bracketed placeholder. For Manual QA, set the automation framework to "Not applicable."

3. Review the suggested tests against the requirements before executing or automating them.

4. Execute the reviewed tests using your QA path and record the actual results.

5. Repeat with a different feature in the same repository.

6. Save both runs and your validation decisions in the evidence file.

Reusable prompt

```
#start sample prompt
Act as a QA assistant. Generate test cases using the information below.

QA path: [Manual or Automation]
Feature: [Feature name]
Requirements: [Paste confirmed requirements]
Actual behavior: [Describe observed behavior]
Test data: [Provide available test data]
Automation framework, if applicable: [Framework]

Instructions:
1. Cover positive, negative, and boundary scenarios supported by
   the requirements.
2. Include the test ID, scenario, preconditions, steps, test data,
   expected result, and priority with a reason.
3. Do not invent validation rules or expected messages.
4. List unclear requirements under "Questions to Confirm."
5. Flag differences between requirements and observed behavior
   as potential defects for verification.
6. For Automation QA, identify automation candidates and explain
   why. Generate code only if requested and sufficient project
   details are provided.

I will review and validate every suggested test before using it.
#end sample prompt
```

How to validate reuse

Use two different features in the same repository:

Task	Manual QA	Automation QA
First: Login	Review and execute the generated cases.	Review the cases and implement suitable automated tests.
Second: Member registration	Reuse the prompt with registration requirements and execute the cases.	Reuse the prompt and implement suitable registration tests.

Use features that actually exist in your application. Login and member registration are examples, not mandatory feature choices.

What to check

- Are the expected results supported by confirmed requirements?

- Did the AI invent rules, messages, limits, or behavior?

- Are the test steps executable and the test data appropriate?

- Are important scenarios missing?

- Does the prompt remain useful when you change the feature inputs?

An incorrect AI expectation is not automatically an application defect. For example, if a success message is not required, its absence alone does not establish a defect. Record the unsupported AI expectation and seek clarification where needed.

Automation QA: review generated code, selectors, and assertions against the actual project. Run the tests and investigate failures before concluding that the application is defective.

Include in your Markdown evidence

- The reusable prompt and instructions

- Inputs and AI outputs for both tasks

- Validation results: accepted, corrected, or rejected suggestions, with reasons

- Actual manual execution results or automated test results

- Any prompt adjustments made after testing

Save as `requirement-based-test-generator.md` and upload under **Week 4 > Activity 1 > Evidence**.

Suggested evidence structure

```
# Requirement-Based Test Case Generator

## Purpose, intended users, and when to use it
[Complete]

## Usage instructions and reusable prompt
[Include the final prompt and instructions]

## Task 1
Feature: [Complete]
Requirement source: [Complete]
Inputs: [Paste]
AI output: [Paste or reference attached evidence]
Accepted/corrected/rejected suggestions and reasons: [Complete]
Actual execution results and evidence: [Complete]

## Task 2 - Different feature or scenario
Feature: [Complete]
How it differs from Task 1: [Complete]
Requirement source: [Complete]
Inputs: [Paste]
AI output: [Paste or reference attached evidence]
Accepted/corrected/rejected suggestions and reasons: [Complete]
Actual execution results and evidence: [Complete]

## Adjustments and limitations
```

```
[Explain changes to the prompt, results after changes, and remaining limits]
```

Activity 2 - Mock Level 3 interview

Prepare

1. Check your coach-assigned partner in the platform. Contact your coach if no partner is assigned; do not choose or change the pairing yourself.

2. Select concrete examples from your Week 2-4 work. Include earlier training evidence where the activity asks for it.

3. Prepare to explain the task, how you used AI, how you validated the output, what you corrected or rejected, and the final result.

Conduct the interview

1. Take turns as interviewer and interviewee so both participants practise answering.

2. Use the interview questions or rubric provided in the activity.

3. Support answers with actual work and evidence rather than general claims about AI.

4. Each partner must provide feedback on at least **two answers** from the other participant. Identify the answer, what was clear, and what needs improvement.

5. Obtain coach feedback on at least **one answer**.

6. Review the feedback and document how you would improve your answers.

Submit

- Complete the interview activity's required fields and evidence uploads.

- Enter your feedback for your assigned partner through the provided partner-feedback workflow. Your partner provides feedback for you using their own account.

- Include the interview evidence and reflection required by the activity, and ensure the required coach feedback is recorded.

- Submit **Week 4 > Activity 2** for review.

Activity 3 - Formal reassessment

What you must do

1. Review your mock-interview feedback and prepare evidence from your actual training work.

2. Use the supplied reassessment instructions in **strict mode**. Use the official assessment prompt and rubric rather than the Activity 1 test-generation prompt.

3. Answer with concrete examples of your workflow and validation decisions. Include a recent real-work example when required by the rubric.

4. Preserve the assessment transcript and result. Record the assessed level and confidence exactly as returned; do not replace them with your own rating.

5. Add the reassessment result to the required assessment tracker.

6. Upload the transcript, tracker, and other required evidence under **Week 4 > Activity 3 > Evidence**. Complete the required fields and submit.

Final Week 4 submission checklist

[ ] All required activities, evidence, daily logs, and revisions for Weeks 1-4 are complete. Week 1 remains General Training reporting only.

[ ] Activity 1 includes a reusable asset validated on two different real tasks.

[ ] Activity 1 Markdown evidence is uploaded and the activity is submitted.

[ ] Activity 2 interview with the assigned partner is complete.

[ ] Activity 2: Schedule a mock interview with your mentor.

[ ] Partner feedback covers at least two answers; coach feedback covers at least one.

[ ] Activity 2 required evidence is provided and the activity is submitted.

[ ] Activity 3 strict-mode reassessment is complete.

[ ] The transcript, tracker, assessed level, and confidence are recorded.

[ ] Activity 3 required evidence is uploaded and the activity is submitted.

[ ] Any coach-requested revisions are addressed and resubmitted.

Completing uploads does not automatically pass the gate. The coach reviews the required activities, evidence, and assessment criteria before confirming the Week 4 gate.
